L7 ANSWER 1 OF 2 HCAPLW COPYRIGHT 2008 ACS on STN  
AB Methods for treating nominally pure crystals having nonlinear optical properties, especially a lithium niobate crystal or lithium tantalate crystal, and which contains foreign atoms which cause absorption of light (particularly Fe<sup>2+</sup> ions) in a residual concentration of <20 ppm in which a thermal oxidation causes the atoms to attain a higher oxidation state (e.g., Fe<sup>3+</sup>) while the excess electrons are eliminated from the crystal by applying a predetd. voltage are described in which the crystal is heated at a rate that increases by <3° per min to a maximum temperature that lies above a predefined threshold value and below the Curie temperature of the crystal, the threshold value being defined by the temperature at which the migration of ions contained in the crystal (particularly Li<sup>+</sup> ions) to the surface of the crystal ceases and being determined based on preceding tests on the same type of specifically doped reference crystals. Oxide nonlinear optical crystals treated as described above, and systems (e.g., frequency doublers and optical parametric oscillators) using the crystals are also described.

L7 ANSWER 2 OF 2 USPATFULL on STN

AB A method for the treatment of a crystal, such as a lithium niobate crystal or lithium tantalate crystal, having nonlinear optical properties. The crystal comprises foreign atoms which bring about specific absorption of radiated light. The foreign atoms are transformed into a lower valent state by means of oxidation. Electrons, which are released during oxidation, are discharged from the crystal with the aid of an external power source.

L8 ANSWER 2 OF 3 HCAPLUS COPYRIGHT 2008 ACS on STN  
AB The invention relates to a method for the treatment of a crystal  
, in particular a lithium niobate crystal or  
lithium tantalate crystal, having nonlinear  
optical properties. The crystal comprises foreign  
atoms which cause specific absorption of radiated light. The  
foreign atoms are transformed into a lower valence state  
by oxidation brought on by, e.g., heat treatment and application of an elec.  
field. Electrons, which are released during oxidation, are discharged from  
the crystal with the aid of an external power source.
